

# In-Home Water Testing for Lead

## A cost-effective and timely method for testing Lead in water at a home's faucets

### Immediate In-Home Results

The ANDalyze testing system can accurately measure the concentration of lead in water **only minutes after sampling**. A Home Inspector can determine if the lead in the water is well below the EPA recommended level of 15 ppb, without the delay and cost of sending samples to a laboratory and waiting weeks for results.

### Proven Technology

The ANDalyze technology has passed a rigorous **EPA validation** testing protocol, verifying its accuracy and precision for testing lead concentrations in water. Inspectors can also test for other target contaminants (including uranium copper, mercury, and zinc) using different sensors.

### Testing Made Easy

The ANDalyze testing method uses color-coded sensors and a rugged handheld fluorometer providing accurate results in seconds. The device offers simple **step-by-step on-screen instructions** and video training and storage of over 240,000 results available for viewing and downloading to your laptop.

### Affordable

At \$8 per faucet test, the AND1100 allows testing of ALL potential sources in a home, quickly identifying issues which would require remediation. Buy a Lead in Homes Testing Kit today, which includes 100 lead tests and the AND1100 fluorometer for only \$2,495, including shipping within the continental U.S.

### Profitable for your Business

This important Lead water testing service offers a significant opportunity for you to increase your home inspection revenue. This is ideal for new customers or as a special offering to past clients.

Suggested Home Inspector Service/Testing sell price: MSRP \$150.00 for testing up to 6 fixtures.
